8th June 2022 A methodology to estimate space heating and domestic hot water energy demand in buildings from low-resolution heat meter data

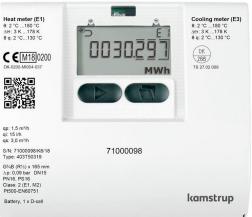

Problem formulation and objectives

Problem formulation:

- The smart energy meters only measure the total energy usage (space heating and DHW)
- By having only minimum information, is it possible to separate the energy demanded for the space heating and the DHW in buildings?

Objectives:

- Separate both energy components Space heating and DHW
- Using hourly measurements
- Having minimum information (total energy and weather data)
- Residential buildings (scopus of this research)

Smart heating meter (https://www.kamstrup.com/enen/submeteringsolutions/propertymanagement/heat-meters)

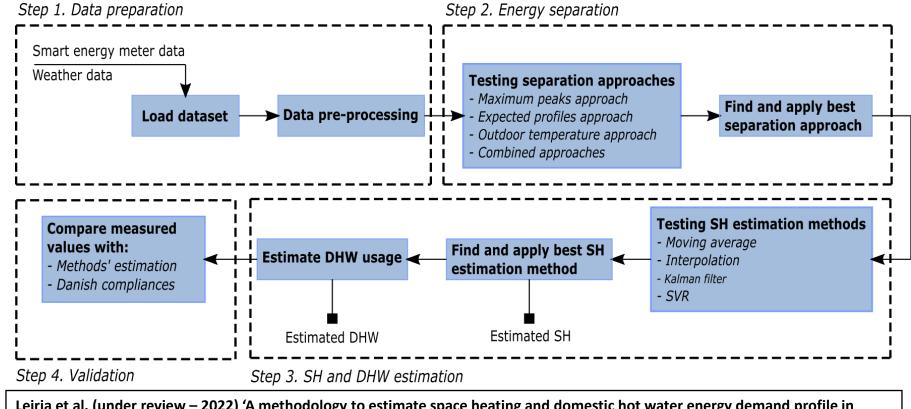

Daniel Leiria

8th June 2022

A methodology to estimate space heating and domestic hot water energy demand in buildings from low-resolution heat meter data

Methodology Introduction

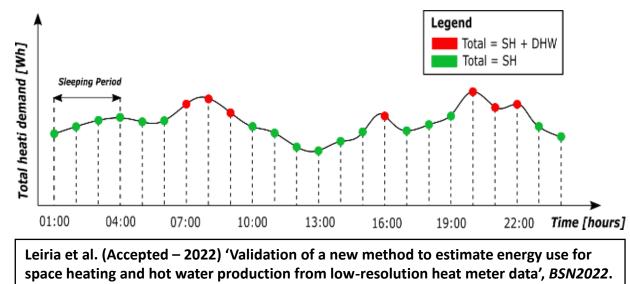

Leiria et al. (under review – 2022) 'A methodology to estimate space heating and domestic hot water energy demand profile in residential buildings from low-resolution heat meter data', *Energy*.

Methodology Energy separation (Step 2)

- Hourly measurements 24 hours (points) per day
- From 24 data points, only few are concerning DHW usage
- The other points are considered space heating data
- This step identifies these few DHW points

8th June 2022

A methodology to estimate space heating and domestic hot water energy demand in buildings from low-resolution heat meter data

Methodology SH and DHW estimation (Step 3)

Several methods were tested

The best was:

8th June 2022

• Gaps \leq 2 hours \rightarrow Kalman smoothing estimator

Variables:

□E_{Total} (All time-series)

• Gaps > 2 hours → Support vector regressor (SVR)

Variables:

Outdoor temperature (i-1)

- Global radiation (i-1)
- □E_{Total} (i-1, i+1)

Results Validation (Step 4)

Used datasets:

- 28 Apartments in **Denmark** (Decimal and rounded measurements)
- 1 Apartment block in Switzerland (Aggregated users measurements)
- 1 Theater in Italy
- 1 Reabilitation institution in Italy
- Comparison with DHW compliances

$$E_{DHW}^{DK} = \frac{1}{3600} \cdot 0.25A \cdot \rho_w c_{p,w} \cdot (T_{DHW} - T_c)$$

$$E_{DHW}^{CH} = \frac{365}{3600} \cdot \frac{0.035}{30}A \cdot n \cdot \rho_w c_{p,w} \cdot (T_{DHW} - T_c)$$

$$E_{DHW}^{ITLY} = \frac{G}{3600} \cdot 10^{-3}V_w \cdot n \cdot \rho_w c_{p,w} \cdot (T_{DHW} - T_c)$$

8th June 2022

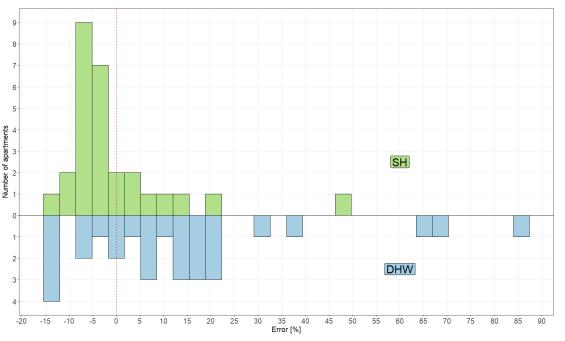

A methodology to estimate space heating and domestic hot water energy demand in buildings from low-resolution heat meter data

Daniel Leiria

Results Method's accuracy – Decimal data

| Apartment ID | Country | DHW measured [kWh/h] | DHW compliances [kWh/h] | DHW estimated [kWh/h] | Error between Measured and Compliances | Error between Measured and Estimated | |
|-----------------|---------|----------------------------|-------------------------------|-----------------------------|--|--|---|
| 666 | Denmark | 0.314 | 0.167 | 0.315 | -47% | 0% | |
| 668 | Denmark | 0.286 | 0.165 | 0.346 | -42% | 21% | |

| Theater | Italy | -35% | 154% |

Leiria et al. (Accepted – 2022) 'Validation of a new method to estimate energy use for space heating and hot water production from low-resolution heat meter data', *BSN2022*.

8th June 2022

A methodology to estimate space heating and domestic hot water energy demand in buildings from low-resolution heat meter data

Further work

- Improving this methodology for rounded measurements and commercial cases is highly needed
- <u>Applying the methodology in other datasets from other countries or other heating</u> <u>appliances</u> to ensure the its robustness and applicability in different cases
- <u>Benchmark this novel methodology with other existing disaggregation methods</u> on a common dataset
- Additionally, a more extensive endeavor must be made to collect good quality datasets and share them with our research peers
